

Nevado residence features a cozy home theater

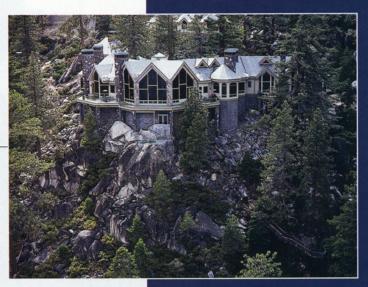

STORY BY GREGORY A. DETOGNE PHOTOGRAPHY BY CHERYL UNGAR

igh above a rocky promontory just above 6,000 feet is an architectural dream come to life.

Shared by a couple seeking to artfully blend the latest entertainment technologies with a

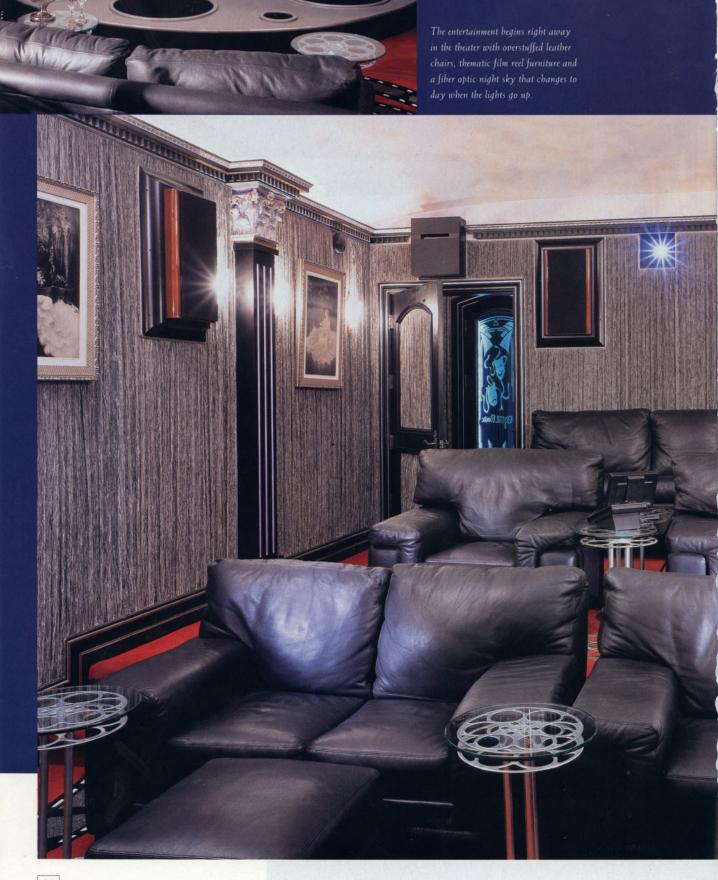

traditional Nevada design, this residential vision took on real dimensions using the work of Reno architect Jeff Lundahl as its foundation.

To create a sense of unity with the majesty of the surrounding mountains, Lundahl's blueprint adopted a largeness of scale. The home is a low, rambling structure divided into main quarters and a guest wing which follow the winding, natural contours of the site. Within the main living space, 11 principal rooms include a polygonal family room, billiards room, solarium, library, home theater, master bedroom, and a gymnasium. "Our goal was to provide a lake view from every major room," notes Lundahl. "To take full advantage of the site's features, we decided to push the house as far out onto the promontory as we could. As a result, the structure wound up following the curves of the hillside terrain in a somewhat serpentine fashion, with each room having a different view of the lake."

A custom Stewart screen and Digital Projection DLP projector bring viewing quality that matches the theater's luxurious decor. Surround sound by Cello, and Sunfire subwoofers literally raise the roof since the ceiling is suspended by spring isolators designed to adjust its height in response to the room's sound pressure level.

While the home's exterior is indeed marked with traditional style, the convenience of electronic technology was equally important. Housewide lighting and HVAC networks, audio system, security and surveillance, and a plush home theater were all integrated by Intelligent Systems Unlimited, (ISU), a Nevada-based firm owned by Wayne Crawford. "Managing the A/V systems in a home of this size would be a nightmare without automation," he says. "Fortunately, given today's technology, we were able to chart a different course. This project took a considerable amount of planning and work on our part, but the end results were quite rewarding."

ISU approached this cliff-top challenge by dividing the electronic systems into individual groups, each reporting to their own centers of control. Within this scheme are three Crestron modular processing units. "These are the main devices which provide our clients with their primary household interface to all systems, including electronic multimedia," Crawford explains. "With over 35 miles of cable and fiber connecting the various systems in this home, there are well over 100 inputs and outputs within the base-level Crestron network alone."

Crawford also installed both wireless and hardwired Crestron touchscreens throughout the house to bring the desired levels of control to the owners' fingertips. In the home theater and family room, VideoTouch LCD touchscreens manage a vast array of systems.

The crown jewel of this residence is an elegant home theater outfitted with a custom micro-perforated electric masking screen from Stewart and a Digital Projection Power DLP projector. A Theta Digital DaVid DVD/CD transport is joined by a Pioneer Elite DVD/LD/CD player. Four Cello Stradivari Legend surround loudspeakers fulfill audio needs in conjunction with Cello Stradivari Grand Master loudspeakers for front- left- and right-channels and a Cello Stradivari Pro Armati center-channel. Sunfire MK-II subwoofers add low-frequency sound reinforcement.

Equipped with double walls featuring hidden diffusers, refractors, and bass traps, the home theater

Audio/video installation and design by Wayne Crawford, ISU Inc., 930 Tahoe Blvd., #802-341 Incline Village, NV 89451; (775) 832-4458. Interior design by Carol John Designs, 16770 Mt. Rose Hwy., Reno, NV 89511; (775) 849-3343. Architecture by Lundahl & Associates, Jeffrey A. Lundahl, president, 1755 East Plumb Lane, Ste. 218, Reno, NV 89502; (775) 348-7777.

A Crestron control system delivers housewide audio/video and shares whatever is playing in the theater with the rest of the house.

is beneath a hand-painted dome ceiling that changes its appearance from a day sky under normal lighting conditions, to a night sky complete with shimmering starlight. The ceiling is suspended upon the house's superstructure in a floating design using spring isolators that permit it to move an inch up or down according to the amounts of acoustical energy present in the room. The home theater is linked to other display sources via the Crestron network so whatever is being shown on the Stewart screen can be distributed throughout the house.

For the housewide music system, Crawford kept everything completely out-of-sight with "invisible" SA2 flat-panel loudspeakers from Sound Advance Systems. The speakers were ceiling-mounted and then covered with either plaster or a drywall mask-

ing compound, depending upon their locations, which spread across a good part of the living spaces and galleries.

Construction to the finish stage took over two years to complete, and Crawford walked away from the job knowing that his clients were happy. "We gave them more home entertainment options and capabilities than they even dreamed about," he concludes. "And they can all be accessed by pressing a single button."
